Amendments to the Claims:

The following listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Withdrawn) A roll comprising a main tape cylindrically wound, the roll comprising a first adhesive tape having an adhesive layer and a print layer laminated thereon,

wherein said adhesive layer of said first adhesive tape is stuck on a surface of said main tape located in the vicinity of a winding terminating position thereof.

2. (Withdrawn) The roll according to claim 1, wherein a width of said first adhesive tape is equal to a width of said main tape.

3. (Withdrawn) The roll according to claim 1, wherein a desired item is printed on said print layer.

4. (Withdrawn) The roll according to claim 1, wherein a first hole is formed in the vicinity of said winding terminating position of said main tape, said first adhesive tape being stuck over said first hole, and

wherein a adhesive layer of said first adhesive tape is stuck, through said first hole, on the surface of said main tape located under said main tape at said winding terminating position.

5. (Withdrawn) The roll according to claim 1, further comprising a core, said main tape being wound up around said core,

wherein a second hole is formed in a winding initiating position of said main tape,

a second adhesive tape having an adhesive layer is stuck on a surface of a portion of said main tape where said second hole is located, and

the adhesive layer of said second adhesive tape exposed in said second hole is stuck on said core.

6. (Withdrawn) A roll comprising a core and a main tape wound up around said core, wherein a second hole is formed in a winding initiating position of the main tape,

a second adhesive tape having an adhesive layer is stuck on a surface of said main tape where said second hole is located, and

the adhesive layer of said second adhesive tape exposed in said second hole is stuck on said core.

7. (Withdrawn) A roll production apparatus for producing a roll by cutting a wide main film along its running direction while running the main film to produce a plurality of narrow main tapes, and by winding each main tape around a core, the apparatus comprising:

a perforator for opening a hole in said main film; and

an adhesive film sending-out unit for sending an adhesive film having an adhesive layer to a surface of said main film located in the vicinity of a position where said hole has been opened,

the apparatus being constituted so as to stick said adhesive film on said main film over said hole, followed by cutting said adhesive film together with said main film along its running direction.

8. (Withdrawn) The roll production apparatus according to claim 7, wherein said adhesive film sending-out unit is a printer constituted so as to print desired information on the surface of said adhesive film.

9. (Withdrawn) The roll production apparatus according to claim 8, wherein said printer is constituted so as to print said information on said adhesive film, followed by sending said adhesive film in a direction the same as the running direction of said main film.

10. (Withdrawn) The roll production apparatus according to claim 9, wherein the apparatus is constituted so that said adhesive film is printed with said information, followed by being stuck on said main film running.

11. (Withdrawn) The roll production apparatus according to claim 8, wherein said printer is disposed so as to print said information on said adhesive film, followed by sending said adhesive film in the direction approximately right angle to the running direction of said main film.

12. (Currently Amended) A process for producing a roll using disposed a slit knife unit, a printer, a wide main film and an adhesive film, comprising the steps of:

extending said wide main film along a running direction perpendicular to a width of said wide main film;

printing a desired item on a first surface of said adhesive film with said printer, said adhesive film having adhesive on a second surface;

adhering said adhesive film by said second surface onto a third surface of said main film while extending said adhesive film along said running direction;

extending said adhesive film and said main film together along said running direction;

cutting said adhesive film together with said main film along the running direction by the slit knife unit to produce a plurality of narrow main tapes; and

winding each of said plurality of narrow main tapes to produce a corresponding narrow roll, wherein said adhesive film printed with the desired item on the surface is arranged on a surface of a portion of said main film where the portion becomes a winding terminating position of said main tapes; a hole is formed in said main film and said adhesive film is thereafter stuck over said hole, and said adhesive film exposed in a bottom of said hole adheres to a surface of said main tape wound in said roll.

13. (Cancelled)

14. (Original) The process for producing a roll according to claim 12, wherein said adhesive film is sent in the direction along the running direction of said main film and is stuck on a surface of said main film.

15. (Original) The process for producing a roll according to claim 12, wherein said adhesive film is sent in the direction perpendicular to the running direction of said main film and is stuck on a surface of said main film.

16. (Cancelled)

17. (Cancelled)

18. (Cancelled)

19. (Cancelled)

20. (Previously Presented) The process for producing a roll according to claim 12, wherein said printer is disposed along the running direction of said main film in the upstream side from said slit knife unit.

21. (Cancelled)
